

Serial No: 10/010,104

IN THE CLAIMS:

Please amend claims 1, 4, 9, 11, 12, 16, 21 and add new claims 23-31 as follows:

1 Claim 1. (currently amended) A device network having selectable target  
2 devices, said device network comprising:

3 a controller device;

4 one or more target devices in communication with said controller  
5 device; and

6 one or more selecting devices, each of which is movable relative to  
7 said target devices, and includes:

8 means for sensing position and orientation to provide data  
9 therefor;

10 means for generating at least one control signal, incorporating  
11 said position and orientation data in response to a user input; and

12 means for transmitting said control signals via at least one of a  
13 plurality of communication resources to said controller device; and

14 wherein said controller device acquires and stores actual location  
15 information for each target device, and assesses correspondence of said  
16 position and orientation data with said actual location data, and if there is  
17 correspondence, outputs a control signal to select said target device to be  
18 operative; and

19 a pointing axis along which the selecting device is aligned when  
20 selecting the one or more target devices.

1 Claim 2. (original) The device network of claim 1, wherein said  
2 controller assesses correspondence from the selecting device position and  
3 orientation and said actual target location by deriving a target orientation,  
4 and determining correspondence of said target orientation with said  
5 orientation data.

1 Claim 3. (original) The device network of claim 1, wherein said  
2 orientation data includes angles between a ray joining the respective points  
3 in a three-dimensional Cartesian system and two respective axes of said  
4 system.

1 Claim 4. (currently amended) The device network of claim 2, wherein  
2 said position sensing means comprises an accelerometer whose output is doubly  
3 integrated to give an output of position, or a positioning means using UWB  
4 (Ultra Wide Band).

Serial No: 10/010,104

1 Claim 5. (original) The device network of claim 4, wherein said  
2 orientation sensing means comprises a gyroscope.

1 Claim 6. (original) The device network of claim 5, wherein said each  
2 selecting device includes a pointing means to line up a said target device.

1 Claim 7. (original) The device network of claim 6, wherein said  
2 pointing means is a display, printed indicium, or pointed shape.

1 Claim 8. (original) The device network of claim 1, wherein  
2 communication between said selecting devices and said controller device is  
3 wireless.

1 Claim 9. (currently amended) The device network of claim 8, wherein  
2 said wireless communication is either RF (radio frequency) or IR (infrared)  
3 type.

1 Claim 10. (original) The device network of claim 1, wherein  
2 communication between said target devices and said controller device is wired  
3 or wireless.

1 Claim 11. (currently amended) A selecting device for selecting one or  
2 more target devices in a device network, said selecting device comprising:  
3 means for sensing position and orientation to provide data therefor;  
4 means for generating at least one control signal, incorporating said  
5 position and orientation data, in response to a user input; and  
6 means for transmitting said control signals via at least one of a  
7 plurality of communication resources to ~~said~~ a controller device; and  
8 a pointing axis along which the selecting device is aligned when  
9 selecting the one or more target devices.

1 Claim 12. (currently amended) The selecting device of claim 11,  
2 wherein said position sensing means comprises an accelerometer whose output  
3 is doubly integrated to give an output of position, or a positioning means  
4 using UWB (Ultra Wide Band).

1 Claim 13. (original) The selecting device of claim 12, wherein said  
2 orientation sensing means comprises a gyroscope.

1 Claim 14. (original) The selecting device of claim 13, wherein said  
2 each selecting device includes a pointing means to line up a said target  
3 device.

Serial No: 10/010,104

Claim 15. (original) The selecting device of claim 11, wherein said transmitting means is wireless.

Claim 16. (currently amended) The selecting device of claim 15, wherein wireless communication is either RF (radio frequency) or IR (infrared) type.

Claim 17-20. (canceled)

Claim 21. (currently amended) A device network having selectable target devices, said device network comprising:

a controller device;

one or more targets; and

one or more selecting devices, each of which is movable relative to said targets, and includes:

means for sensing position and orientation to provide data therefor;

means for generating at least one control signal, incorporating said position and orientation data in response to a user input; and

means for transmitting said control signals via at least one of a plurality of communication resources to said controller device; and

wherein said controller device stores actual location information for each target, and assesses correspondence of said position and orientation data with said actual location data, and if there is correspondence, selects said target; and

a pointing axis along which the selecting device is aligned when selecting the one or more targets.

Claim 22. (original) The device of claim 21, wherein said controller assesses correspondence from the selecting device position and orientation and said actual target location by deriving a target orientation, and determining correspondence of said target orientation with said orientation data.

Claim 23. (new) The device network of claim 1, wherein the at least one of the selecting devices further includes pointing indicia for pointing to target devices in alignment to the pointing axis.

Claim 24. (new) The device network of claim 1, wherein the controller device is configured to determine if the target devices are within an angular window along the pointing axis.

Serial No: 10/010,104

1 Claim 25. (new) The device network of claim 1, wherein the controller  
2 is configured to select the least loaded target device if the pointing axis  
3 is aligned with more than one target device.

1 Claim 26. (new) The selecting device of claim 11, wherein the at least  
2 one of the selecting devices further includes pointing indicia for pointing  
3 to target devices in alignment to the pointing axis.

1 Claim 27. (new) The selecting device of claim 11, wherein the  
2 controller device is configured to determine if the target devices are within  
3 an angular window along the pointing axis.

1 Claim 28. (new) The selecting device of claim 11, wherein the  
2 controller is configured to select the least loaded target device if the  
3 pointing axis is aligned with more than one target device.

1 Claim 29. (new) The device of claim 21, wherein the at least one of  
2 the selecting devices further includes pointing indicia for pointing to  
3 targets in alignment to the pointing axis.

1 Claim 30. (new) The device of claim 21, wherein the controller device  
2 is configured to determine if the targets are within an angular window along  
3 the pointing axis.

1 Claim 31. (new) The device of claim 21, wherein the controller is  
2 configured to select the least loaded target device if the pointing axis is  
3 aligned with more than one target.
